

## Casino Payouts

*Online casino payout* is a numerical value that is based on monthly casino statistics and as a rule computed by a third party auditing company. The online casino payout is a numerical factor which describes ratio between how much money people have won in online casino and amount of money kept by this casino for given month.

For example: Let casino payout equal 97.56% and let us assume that all players have gambled away 1,000,000 \$ at this casino in total. In that case \$975,600 was won back or returned to the players in a different way, leaving the casino with \$24,400 in all.

Please note that online casino payouts are very significant aspect you need to consider when you choose an online casino. Of course, there are many other sides you need to consider before playing online. It would be a good thing to keep in mind such important things like casino certification, technical support, quality of online casino software, payment options and other casino features. Casino payout rates can be crucial to your odds of winning and you will be able to make your own estimates and conclusions about quality of an online casino. But you have to make sure that your payout figures were derived from actual statistics and were verified by well-known auditing company like PriceWaterhouseCooper or Online Players Association.

The well-known consulting & auditing company PriceWaterhouseCoopers checks the game results and statistics of many known online casinos. Evidential matter updates every month and as a result company makes auditor's conclusion. Evidential matter includes a lot of different activities and characteristics. Online casino payout is one of them. Casino payout value can be adduced for Online Casino as a whole and for single games in particular. We have made an effort to gather data about casino payouts from different sources. You can see the result of our modest effort below:

Casino	% for All Games	% for Slot Games	% for Table Games	% for Poker Games	Software
